

# Hand in hand to create a number reader

Computer vision helps operators to wire the aircraft cockpit

Wiring a cockpit is a precision job. The wires are marked with an 8-digit code to help the operator place them. Until now, they were read manually.

The digit reader developed in close collaboration with Altran Fablab allows the operator to automatically read and record the codes placed on the wires.

This device helps operators to fill in the numbers correctly and to avoid wiring errors.
